

rustc_codegen_gcc: A gcc codegen for the Rust compiler

Monday, September 20, 2021 8:00 AM (45 minutes)

The Rust programming language is becoming more and more popular: it's even considered as another language allowed in the Linux kernel.

That brought up the question of architecture support as the official Rust compiler is based on LLVM.

This project, `rustc_codegen_gcc`, is meant to plug the GCC backend to the Rust compiler frontend as a relatively low-effort: it's a shared library reusing the same API provided by the Rust compiler as the `cranelift` backend.

As such, it could be used by some Linux projects as a way to provide their Rust softwares to more architectures.

This talk will present this project and its progress.
