Service Management and systemd MC

The focus of this microconference will be on topics related to the current state of host-level service management and ideas for the future.

As systemd is one of the most widely adopted service managers in Linux distributions today, we expect that most of the contributions will be based around the systemd ecosystem. We're also welcome to submissions that are not specific to systemd so we can discover and share new ideas on how to improve service management in general.

We expect submissions to be either open discussions or presentations that discuss new proposals/ideas, ongoing work, or problems we are/should be solving in this space. Submissions are recommended to be 15 - 45 minutes long. Please specify the format, the desired length of your submission, and how much, if any, additional time to allocate for discussion in your abstracts.

I agree to abide by the anti-harassment policy
