Regression tracking & fixing: current state, problems, and next steps

Wednesday, September 14, 2022 10:00 AM (45 minutes)

This session will provide a very quick and brief overview about Thorsten's recent regression tracking efforts, which are performed with the help of the regression tracking bot "regzbot". Thorsten afterwards wants to outline and discuss a few oddities and problems in Linux development he noticed during his work that plague users –for example how bugzilla.kernel.org is badly handled and how some regressions are resolved only slowly, as the fixes take a long time to get mainlined.

In addition to that he will also outline some of the problems that make regression tracking hard for him in the hope a discussion will find ways to improve things. The session is also meant as a general forum to provide feedback to Thorsten about his work and discuss the further direction.
