The Maple Tree

Wednesday 14 September 2022 17:45 (45 minutes)

The maple tree is a kernel data structure designed to handle ranges. Originally developed to track VMAs but found new users before inclusion in mainline, the tree has many uses outside of the MM subsystem. I would like to talk about the current use cases that have arose and find out about any other uses that could be integrated into future plans.

I agree to abide by the anti-harassment policy

Yes
