Quality in embargoed patches

Monday, 13 November 2023 11:30 (25 minutes)

The bar on the quality of code that fixes embargoed issues is pretty low: usually the case is that the code is only tested by the author, and possibly a handful of other folks who are part of working on the fix.

This session is a discussion to help draft a proposal for a testing story that could be presented to HW vendors that wish to publish embargoed code without going through the kernel's usual review process.
