Graphing Tools for Scheduler Tracing

Julia Lawall, Inria November 14, 2023

- The task scheduler can have a large impact on application performance.
- But the task scheduler is buried deep in the OS...

- The task scheduler can have a large impact on application performance.
- But the task scheduler is buried deep in the OS...
- How to understand what the task scheduler is doing?

trace-cmd: Collects ftrace information, including scheduling events.

trace-cmd record -e sched -q -o trace.dat ./mycommand

Sample trace (trace-cmd report trace.dat):

C1 CompilerThre-166659 [026] 9539.524366: sched_wakeup: C1 CompilerThre:166654 [120] success=1 CPU:062 <idle>-0 [062] 9539.524369: sched_switch: swapper/62:0 [120] R ==> C1 CompilerThre:166654 [120] C1 CompilerThre-166659 [026] 9539.524369: sched_switch: C1 CompilerThre:166659 [120] S ==> swapper/26:0 [120] java-166654 [062] 9539.524372: sched_switch: comm=C1 CompilerThre:166659 [120] Target_cpu=028

kernelshark: Graphical front end for trace-cmd data.

Hard to get an overview, of e.g. 128 cores.

Goals for a trace-visualization tool:

- See activity on all cores at once.
- Produce files that can be shared (pdfs).
- Caveat: Interactivity (e.g., zooming) completely abandoned.

- dat2graph: Horizontal bar graph showing what is happening on each core at each time.
- running_waiting: Line graph of how many tasks are running or waiting on a runqueue at any point in time.

- dat2graph: Horizontal bar graph showing what is happening on each core at each time.
- running_waiting: Line graph of how many tasks are running or waiting on a runqueue at any point in time.
- stepper: Step-by-step execution of all tasks on all cores.
- hostguest: Activity on vcpus + status of vcpus as running or waiting.

- dat2graph: Horizontal bar graph showing what is happening on each core at each time.
- running_waiting: Line graph of how many tasks are running or waiting on a runqueue at any point in time.
- stepper: Step-by-step execution of all tasks on all cores.
- hostguest: Activity on vcpus + status of vcpus as running or waiting.

All publicly available.

NAS benchmark suite: "The NAS Parallel Benchmarks (NPB) are a small set of programs designed to help evaluate the performance of parallel supercomputers. The benchmarks are derived from computational fluid dynamics (CFD) applications..."

Our focus:

- UA: "Unstructured Adaptive mesh, dynamic and irregular memory access"
 - N tasks on N cores.

A common approach for scientific code is to pin tasks to cores:

(All tests on a 4-socket machine with 128 hardware threads.)

A common approach for scientific code is to pin tasks to cores:

(All tests on a 4-socket machine with 128 hardware threads.)

Suggests that memory locality impacts performance.

UA without pinning, before and after EEVDF (Linux v6.5 and v6.6)

A slow run in v6.5 (dat2graph)

ua.C.x_yeti-3_6.5.0_performance_2 socketorder, duration: 35.277310 seconds

A slow run in v6.5 (dat2graph)

A slow run in v6.6 (dat2graph)

ua.C.x_yeti-3_6.6.0_performance_10 socketorder, duration: 83.800233 seconds

A slow run in v6.6 (dat2graph)

The impact of gaps depends on the reason why they are present:

- Tasks have nothing to do.
 - No performance impact.
- Some cores are **overloaded** while others are idle (work conservation issue).
 - Potential slowdown.

Detecting overloads: Focus on UA threads (running_waiting)

Detecting overloads: Focus on UA threads, by socket (running_waiting)

Detecting overloads: Focus on UA threads, by socket (running_waiting)

Maybe NUMA balancing is the culprit?

NUMA balancing in v6.5 (dat2graph --events)

NUMA balancing in v6.6 (dat2graph --events)

What's new with EEVDF?

What's new with EEVDF?

Does it matter that they are all one tick?

What's new with EEVDF?

Does it matter that they are all one tick? Or that they are all the same?

And that's where the story ends...

• What goes wrong with UA?

- What goes wrong with UA?
- What information is useful to visualize?
- How to organize it?
- How to visualize new information (e.g., timeslice)?

A proposal

dat2graph:

An edge between task start and stop.

```
@dat2graph@
comm c1, c2, c3;
pid p1, p2 != 0, p3;
time t1, t2;
core c;
@@
```

```
sched_switch(c1,p1,_,c2,p2)@t1@c
...
sched_switch(c2,p2,_,c3,p3)@t2@c
==> edge(point(t1,c),point(t2,c),color(p2))
```

A proposal

dat2graph:

An edge between task start and stop.

@dat2graph@

```
comm c1, c2, c3;
pid p1, p2 != 0, p3;
time t1, t2;
core c;
@@
```

```
sched_switch(c1,p1,_,c2,p2)@t1@c
```

```
. . .
```

```
sched_switch(c2,p2,_,c3,p3)@t2@c
=> edge(point(t1,c),point(t2,c),color(p2))
```

timeslice:

Collect time between task start and stop.

@timeslice@

comm c1, c2, c3; pid p1, p2 != 0, p3; time t1, t2; core c; reason r; @@

```
sched_switch(c1,p1,_,c2,p2)@t1@c
...
sched_switch(c2,p2,r,c3,p3)@t2@c
==> collect(r, t2 - t1)
```

running_waiting: Keep a count of running tasks.

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
sched_switch(_,0,_,c,p)@t
=> running[t] = ++running_count
```

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
sched_switch(c,p,_,_,0)@t
==> running[t] = --running_count
```

running_waiting: Keep a count of running tasks.

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
sched_switch(_,0,_,c,p)@t
=> running[t] = ++running_count
```

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
sched_switch(c,p,_,_,0)@t
=> running[t] = --running_count
```

Waiting is more complex, because a task can be waiting for multiple reasons.

An alternative

Focus on task states, rather than events.

```
@running_waiting@
comm c; pid p != 0; time t;
@@
```

```
In(running(c,p))@t
=> running[t] = ++running_count;
   waiting[t] = ++waiting_count;
```

```
@running_waiting@
comm c; pid p != 0; time t;
@@
```

```
Out(running(c,p))@t
=> running[t] = --running_count;
   waiting[t] = --waiting_count;
```

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
In(waiting(c,p))@t
==> waiting[t] = ++waiting_count
```

```
@running_waiting@
comm c; pid p; time t;
@@
```

```
Out(waiting(c,p))@t
==> waiting[t] = --waiting_count;
```

- dat2graph: Horizontal bar graph showing what is happening on each core at each time.
- running_waiting: Line graph of how many tasks are running or waiting on a runqueue at any point in time.
- stepper: Step-by-step execution of all tasks on all cores.
- hostguest: Activity on vcpus + status of vcpus as running or waiting.
