Making MIPI DSI power states fit Linux kernel

Wednesday, 18 September 2024 15:30 (30 minutes)

While MIPI DSI bus and MIPI devices has been supported in Linux kernel for quite a while, during the last few years several important corner cases were identified, which make it hard to fit the MIPI DSI devices into the standard DRM pre-enable / enable / disable / post-disable model. Some of the shortcomings were solved via the `pre_enable_prev_first` call, other shortcomings remain unsolved. This session describes a proposed solutions for the MIPI DSI drivers model.
