Actionable Data Access Monitoring Output Data and Format

DAMON simplifies the collection of system and workload data access patterns. However, interpreting this data and transforming it into actionable insights for humans remains a challenge. Representing the data in an actionable format is difficult. While efforts have been made to visualize this data, opinions vary on its accessibility. This session will review past attempts to make the data consumable and actionable, outline future plans, and foster a discussion with the audience on improved visualization methods.
