Linux CVE workgroup

After last year's BoF on Linux CVEs, several organizations have gathered together to form a workgroup, aiming at sharing CVE assessments to reduce the amount of toil of isolated triaging (<https://github.com/cloud-lts/linux-cve-analysis>). In this session we would like to present the progress we made so far, going over the current challenges and gather inputs from the community. This is also the occasion to present the initiative to those who may be interested in joining it, showing the value it can bring.
