

From Projects to Ecosystems: Lessons from the eBPF Foundation

To innovate and enable others to innovate

Developer Face to Face

Linux Kernel Developers' bpfconf 2025

bpfconf is an invitation-only technical workshop run by the Linux community in order to bring BPF core developers together, to discuss new ideas and to work out improvements to the BPF subsystem that will make their way into future mainline kernels and into the BPF compiler backends.

The conference is purposely kept small with focus on discussion rather than just presentation. Along with the LPC's [BPF Track](#) which is organized and run by the same community, the goal is to allow developers to meet face to face twice per year to exchange and discuss ongoing developments in the BPF ecosystem.

The 2025 bpfconf edition is a three-days conference which is part of the [LSE/MM/BPF summit](#). It is therefore also open to all LSF/MM/BPF attendees.

Discussion Topics

The following discussion topics have been brought up at this year's bpfconf. In each slot below, there is a short discussion topic with a link to the corresponding slides in case slides have been used as a discussion starter.

LWN coverage of the BPF track from Jonathan Corbet can be found [here](#).

xmulligan Add reimbursement guidelines for eBPF Meetup Groups (#2)

9a09489 · yesterday History

Preview Code Blame 36 lines (28 loc) · 2.73 KB

Meetup Groups hosting an event about eBPF can be reimbursed for up to \$150 per month for Meetup-related expenses as long as they are using and hosting events on community.cncf.io or meetup.com, including food, beverages, and other expenses.

Event Eligibility & Verification

To ensure the integrity of the program, expenses will only be reimbursed for approved events. To qualify:

1. Platform Requirement: The group must be active and the specific event must be hosted/listed on community.cncf.io or meetup.com.
2. Content Focus: The agenda must primarily focus on eBPF technology or use cases.
3. Proof of Event: To verify the event took place, you must include a link to the specific event page and a number of attendees.

Reimbursement Instructions:

1. Create an account in the recommended expense report software expensify.com (if you already have a expense report software you can use that software if you prefer)
2. Create a report through expensify.com and attach receipts to the full report. Export as a PDF
 - Please expense receipts after you have spent the money.
 - Please submit one invoice for any related expenses within a calendar month.
 - No rounding.
 - The totals of report should be in USD by default it's in local currency [check here how to modify currency for reports in Expensify](#)
 - We require receipts for your expenses.

* Meetup program coming soon

selftests/bpf: integrate test_tc_edt into test_progs

test_tc_edt.sh uses a pair of veth and a BPF program attached to the TX veth to shape the traffic to 5Mbps. It then checks that the amount of received bytes (at interface level), compared to the TX duration, indeed matches 5Mbps.

Convert this test script to the test_progs framework:

- keep the double veth setup, isolated in two veths
- run a small tcp server, and connect client to server
- push a pre-configured amount of bytes, and measure how much time has been needed to push those
- ensure that this rate is in a 2% error margin around the target rate

This two percent value, while being tight, is hopefully large enough to not make the test too flaky in CI, while also turning it into a small example of BPF-based shaping.

Improving the eBPF tests in the kernel

Alexis Lathoré

March 17, 2025

Technical

ebpf, testing, upstream

As part of a partnership with the [eBPF Foundation](#), Bootlin engineers [Bastien Curutchet](#) and [Alexis Lathoré](#) are working with the kernel community in order to improve eBPF support in the kernel on different aspects. This post is the first one of a series highlighting this effort. For those who need to catch up with the eBPF technology, you can take a look at our “[Linux Debugging, tracing and profiling](#)” training course which has been [recently updated](#) with eBPF basics !

- **Runtime Type Information via BTF:** Solved DWARF size constraints (reducing ~200MB to ~5MB) allowing embedding runtime-loadable type data for dynamic function modeling
- **Low-Overhead Trampolines:** Replaced expensive kprobes with direct function calls acting as a dynamic ABI bridge for fentry/fexit
- **ARM64 Feature Parity:** Multi-kprobes and complex argument handling for functions with >8 parameters (stack-passed args)
- **Test Suite Modernization:** Migrated legacy standalone shell scripts to the generic test_progs C runner
- **Expanded CI Coverage:** Increased automated regression testing reliability on bpf-next

What SOWs should we fund in the future?

- riscv64 BPF JIT on par with x86-64 & arm64
- XXX

eBPF Verifier Code Review

NCC Group
Version 1.0 – November 11, 2024

Prepared By
Chris Anley
Nathaniel Theis

Prepared For
eBPF Foundation

5 Finding Details

High **find_equal_scalars Mishandles 32-Bit Addition**

Overall Risk	High	Finding ID	NCC-E015561-JJX
Impact	High	Component	eBPF verifier
Exploitability	Low	Category	Data Validation
		Status	Fixed

Impact

An attacker with CAP_BPF (required to reach the vulnerable code paths) who can load & execute eBPF programs on a vulnerable system can read to, and write from, arbitrary kernel memory.

Description

A vulnerability in the eBPF verifier permits an attacker to submit and run an eBPF program that can read from, and write to, arbitrary kernel memory.

The issue involves the tracking of eBPF register values, and specifically the identification of equal scalars. The specific vulnerable code is related to the `find_equal_scalars()` function and the `BPF_ADD_CONST` flag, which signifies a constant offset between two scalar registers.

An attacker requires either root privilege or CAP_BPF² to successfully exploit the issue. Additionally, the POC code below requires CAP_PERFMON, because it doesn't bypass the ALU sanitizer (although in an actual exploit this can be achieved with previously documented³ methods).

The verifier attempts to track "similar" scalars in order to propagate bounds information learned about one scalar to others. For instance, if `r1` and `r2` are known to contain the same value, then upon encountering `lf (r1 != 0x1234) goto 1234;`, not only does it know that `r1` is equal to `0x1234` on the path where that conditional jump is not taken, it also knows that `r2` is.

Additionally, if `env->bpf_capable` (i.e. if the process loading this eBPF program has CAP_BPF), the verifier will track scalars which should be a constant delta apart (if `r1` is known to be one greater than `r2`, then if `r1` is known to be equal to `0x1234`, `r2` must be equal to `0x1233`).

The relevant code from `adjust_reg_min_max_vals()`, located at `kernel/bpf/verifier.c:14101`:

```
if (env->bpf_capable && BPF_OP((non->code) == BPF_ADD &&
    dst_reg_id && !is_reg_const(src_reg, alu32)) {
    u64 val = reg_const_value(src_reg, alu32);

    if ((dst_reg_id & BPF_ADD_CONST) ||
        /* prevent overflow in find_equal_scalars() later */
        val > (u32)532_MAX) {
```

2. CAP_BPF is a Linux kernel capability which serves several purposes. First, it allows certain eBPF operations such as creating maps. Second, it enables more sophisticated analysis in the eBPF verifier (including the vulnerable scalar-offset analysis documented in this finding). Third, if unprivileged eBPF is disabled by the `unprivileged_bpf_disabled` sysctl - as it currently is on most popular distributions by default - CAP_BPF is required to load any BPF program.

3. A technique is described in this [writeup](#) by Manfred Paul of his winning entry in the Pwn2Own 2020 competition.

eBPF

Security Threat Model

Jack Kelly, James Callaghan & Andrew Martin

control-plane.io

\$225,000 grant from Alpha-Omega for:

- Defensive runtime tooling
 - **Enabling KASAN** for JIT-compiled eBPF programs to validate memory accesses
- Auditing
 - **Security review of x86-64, arm64, and riscv64 JIT compilers**, specifically targeting vulnerabilities in instruction encoding, register allocation, and immediate value handling
 - **Check verifier-to-JIT integrity** ensuring security assumptions (memory boundaries, control flow) are preserved in translation
 - **Assessment of unprivileged surfaces**, cBPF to eBPF translation (bpf_convert_filter) and seccomp filter validation

How can we improve eBPF security?

BYTEDANCE USES eBPF TO ENHANCE NETWORKING PERFORMANCE

OVERVIEW

ByteDance, a global technology company operating a wide range of content platforms around the world as massive scale, faced significant challenges in ensuring performance and stability across its data centers. With over a million servers running containerized applications, the company required a networking solution that could handle high throughput while maintaining stability. By leveraging eBPF technology, ByteDance successfully implemented a decentralized networking solution that improved efficiency, scalability, and performance.

CHALLENGE

- Asynchronous scaling** to operations, its existing container networking stack, which relied on virtual Ethernet devices, began showing limitations, key challenges included:
 - Performance Bottlenecks:** The virtual Ethernet-based solution introduced self-intermittent bottlenecks in the network stack, causing inefficiencies.
 - Stability Concerns:** Ensuring stability at such a large scale was critical, but network solutions posed risks in production environments.
 - Kernel Version Constraints:** Upgrading to the required kernel version of 4.18 was not immediately feasible due to operational constraints.
- To address these challenges, ByteDance required a robust, scalable, and high-performance solution that could be deployed incrementally across its data centers.

SOLUTION

- ByteDance moved to eBPF to address these challenges, eBPF, a powerful technology for dynamically and safely reprogramming the Linux kernel, enabled the company to redesign its networking stack, key steps in the implementation included:
 - Introducing metrics:** By introducing `ebpf`, an eBPF-powered networking device introduced in version 6.8 of the Linux kernel, which enabled visibility to drive innovation over traditional virtual Ethernet to container networking.
 - To ensure compatibility with legacy devices, network stacks were backported to kernel version 4.18, ensuring compatibility with ByteDance's infrastructure.
- Rolling Upgrade Strategy:** A carefully orchestrated upgrade process ensured minimal disruption. The container networking interface and kernel upgrades were managed independently, allowing a gradual transition to test and validate eBPF-based networking performance against existing setups, its compatibility between network and virtual Ethernet to container networking.
- Handling Failures:** Comprehensive fallback mechanisms were implemented to handle scenarios where network or its associated eBPF programs failed to ensure uninterrupted service.

Meta's adoption of eBPF and its transformative potential of the network scale networking challenges. By node and leveraging the flexibility of eBPF, measurable performance improvement and stability. This deployment was capable to drive innovation over traditional virtual Ethernet to container networking.

- To ensure compatibility with legacy devices, network stacks were backported to kernel version 4.18, ensuring compatibility with ByteDance's infrastructure.

eBPF Foundation Announces Inaugural Community & Advocacy Fellowship Recipients

By Dan Brown | October 15, 2025 | 4 min read

TL;DR

The **eBPF Foundation** announced the recipients of its inaugural **Community & Advocacy Fellowship**, recognizing contributors expanding global access to eBPF through education, tutorials, and community-building. The 2025 fellows are **Teodor Janez Podobnik** (eBPFChirp Newsletter) and **Yusheng Zheng** (bpf-developer-tutorial).

What information would be helpful to surface?

Who are our members

Platinum

Silver

How you benefit from membership

• Strategic Influence

Take part in shaping the technical roadmap and key decisions for the future of eBPF.

• Cross-Platform Collaboration

Work openly with leading industry leaders and developers in a neutral, collaborative environment.

• Security & Research

Contribute to security audits, threat modeling, and academic research to strengthen eBPF.

• Visibility & Credibility

Build your organization's reputation as a trusted and visible leader in the open source ecosystem.

Flexible membership tiers for every organization

Choose the level that aligns with your organization's size and goals. All tiers include participation, visibility, and collaboration opportunities.

Silver

\$5,000 – \$30,000

- 5,000+ Employees – \$30,000 (\$10,000 For LF Members)
- 500-4,999 Employees – \$25,000 (\$10,000 For LF Members)
- 100-499 Employees – \$15,000 (\$5,000 For LF Members)
- Up to 99 Employees – \$10,000 (\$5,000 For LF Members)
