## How to be better citizens: from changes review to changes testing

*Wednesday, November 14, 2018 2:45 PM (15 minutes)*

Despite the continuous and encouraging improvements, AOSP stable kernels have still a certain delta with respect to mainline. Some features are still unique to AOSP (e.g. WALT or SchedTune), others are back-port from mainline (e.g. idle loop optimization). Whenever an existing feature is modified, or a new/backported feature is proposed for an AOSP stable kernel, apart from a great code review on gerrit, we would like to increase our confidence on the quality of the changes by testing their impact on few key areas: interactivity, energy efficiency and performance. This slot will be dedicated on describing a possible solution with, the main goal is to collect feedbacks on how to increase its adoption by AOSP common kernel's contributors.
