

Update on the BPF support in the GNU Toolchain

Jose E. Marchesi

Oracle Inc.

GNU Tools Track @ LPC 2020

Contents

- 1 The project
- 2 The Port
- 3 xBPF
- 4 BTF, CO-RE
- 5 Diversity of debugging formats in GCC
- 6 New debug hooks in GCC?

The Project

BPF: in-kernel virtual machine.

- **Phase 1:** add BPF target to the toolchain
- **Phase 2:** make the generated programs palatable for the kernel loaders and verifier, and **keep it that way.**
- **Phase 3:** provide other development goodies for BPF developers (simulator, debugger, tracer, etc.)

The Port

bpf-unknown-none

- **binutils port**

- Upstream since Aug 2019.
- Debian: binutils-bpf.
- Oracle Linux 8: cross-binutils.

- **GCC backend**

- Upstream since Sep 2019.
- Debian: gcc-bpf.
- Oracle Linux 8: cross-gcc.

- **GDB port**

- Upstream since Aug 2020.

- **Simulator**

- Upstream since Aug 2020.

- **Dejagnu board**

- bpf-sim

xBPF

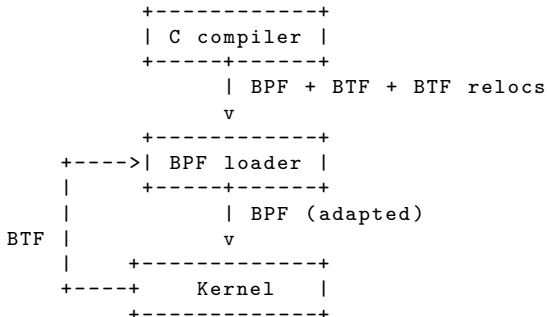

- Experimental BPF.
- Purpose: compiler testing, BPF debugging, userland.
- `-mxbpf` in GCC and GAS.
- Current extensions:
 - Save/restored callee-saved used registers.
 - Indirect calls: `callr %reg`
- Coming extensions:
 - Signed division instruction.
 - Zero register?
 - Indirect jumps.
 - `%fp` relative addressing.
 - Remove limit on stack frame size.

BTF

- Debugging format used by eBPF.
- Similar to CTF.
- `bpf-unknown-none-gcc -g` should generate BTF, not DWARF.
- Instrumental for CO-RE.

BPF Compile-Once, Run-Everywhere

- BTF and field offset relocs
(`__builtin_preserve_access_index`)
- Kernel headers: `/sys/kernel/btf/vmlinux` → `vmlinux.h`

Diversity of debugging formats in GCC

- LLVM

```
IR --> class DebugHandlerBase +--> DWARF
                                   --+--> CodeView
                                   +--> BTF
```

- GCC

```
tree      --+          +--> dwarf2out
rtl       --+          +--> dbxout
          +--> debug_hooks --+--> vmsdbgout
backends  --+          +--> xcoffout
lto       --+          +--> godump
```

New debug hooks in GCC?

- Step 1:

```

      +--> godump
      +--> xcoffout
debug_hooks -+--> vmsdbgout
      +--> dbxout
      +--> dwarf2out --> n_debug_hooks --+--> DWARF
                        (walk)          +--> BTF
                        +--> CTF
```

- Step 2:

```

tree      --+
rtl      --+
      +--> (dwarf) -> debug_hooks --+--> DWARF (-gdwarf)
      +--> BTF (-gbtf)
lto      --+      ^
backend  --+      |
      :          |
-g|-gLEVEL  |      |
      +-----+
                        U inf. control
```

- Step 3: everyone is happy :-)

Idea: xBPF based Infinity

Note compiler	i8c	bpf-unknown-none-gcc
Note testing framework	i8i	bpf-unknown-none-run
Client library	libi8x	libxbpf (TBW)
