

CFS flat runqueue v2

Tuesday, August 25, 2020 10:40 AM (30 minutes)

Last year I presented an approach to flatten the hierarchical runqueues used with the CPU controller in CFS, and Paul Turner came up with what we thought at the time were some insurmountable problems.

However, it looks like one relatively small change in how and when vruntime is accounted, and what is done with tasks that cannot have all of their delta exec runtime converted into vruntime at once, should resolve the corner cases that were present in last year's code.

I hope to use this presentation and discussion session to ascertain whether that is indeed the case :)
