

Update on fw_devlink

Monday, August 24, 2020 8:05 AM (15 minutes)

fw_devlink is a new feature that got into upstream in the past year. It adds device links between devices by parsing the firmware. This talk will provide a quick refresher of what it does (talked a bit about it in LPC 2019) and what changes got in since then.

Also, provide a refresher on how sync_state() works and what it is and can be used for.
