Development Story

igalia

Development Story

- Driver code name: V3DV.
- Development in a public fork of Mesa.
- Leverages Mesa Vulkan WSI.
- Expands existing V3D NIR compiler.
- Same kernel interface as V3D.

igalia

Development Story

- [Nov 19] Development start.
- [Jan 20] Triangle demo.
- [May 20] Bunch of Sascha Willem’s demos running.
- [Jun 20] Moved development to open repositories.
- [Jul 20] All Quake games working.
- [Aug 20] Minimal Vulkan 1.0 implementation.

igalia

Development Story

- Initial early milestone to render on hardware.
- Vulkan CTS to help iterative feature development.
  - Requires minimal functionality in the driver first.
  - Helped improve CTS coverage over time.

igalia

Development Story

- Growing subset of CTS for regression testing.
  - Parallel deqp runner for faster execution.
  - Currently ~10K tests (~10% of CTS pass list).
- Weekly rebases and full CTS runs.
- Assert everywhere philosophy.
- Progress updates via developer blog posts.

igalia

Current State

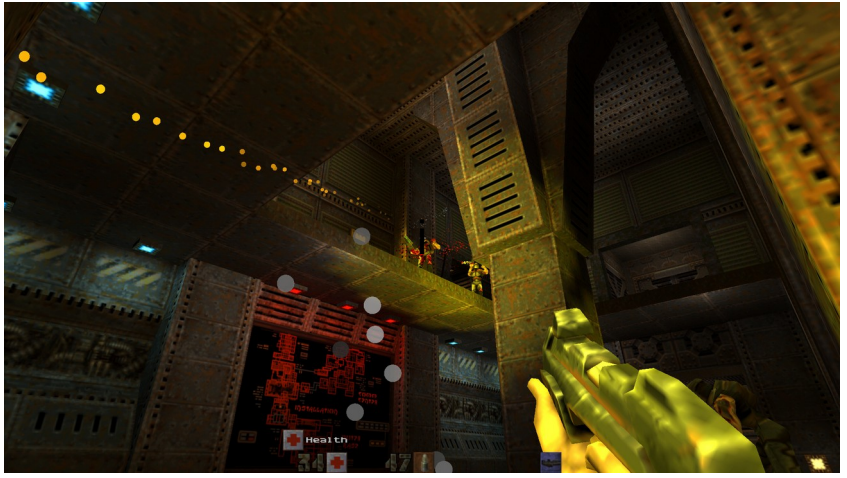
Current State

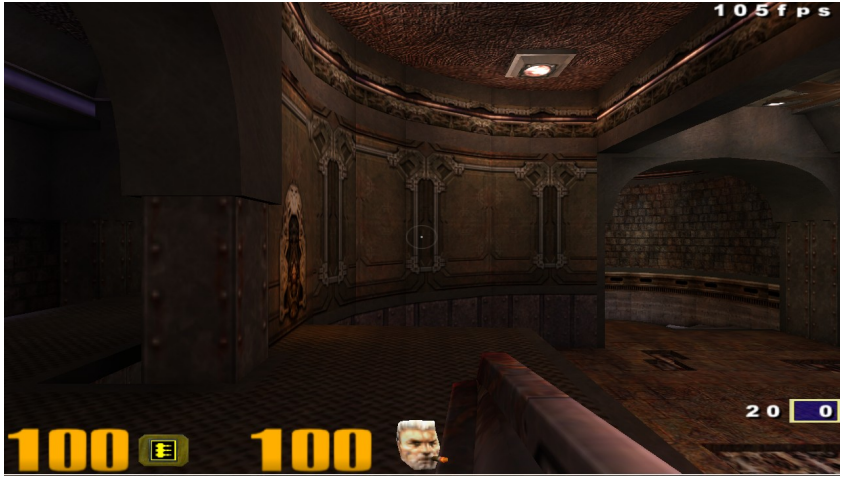
- Vulkan 1.0 mandatory feature set complete.
  - A bunch of optional features too.
  - Many optional features and extensions missing.
- Current focus on CTS conformance.
  - Passing ~110K tests, ~20 test fails to go.

igalia

Current State

- VkQuake 1-3 & OpenArena.
- PPSSPP (Vulkan PSP emulator).

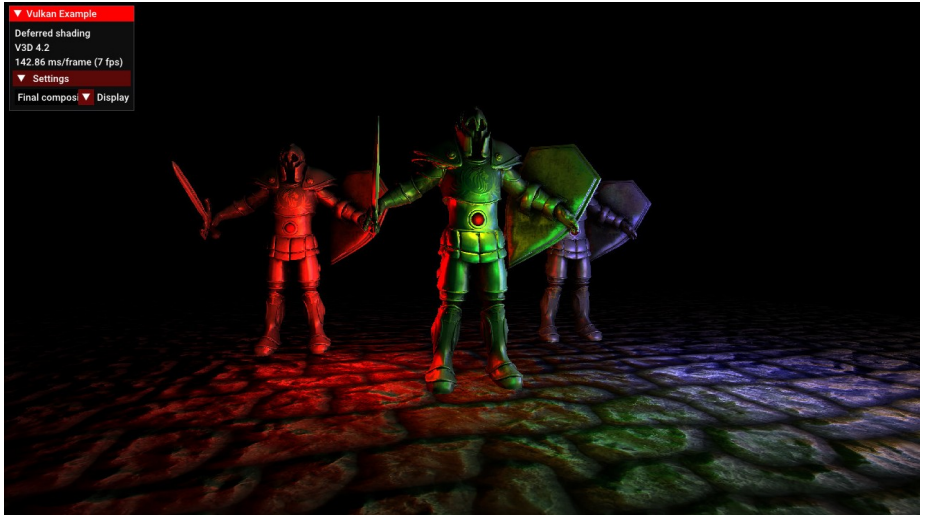


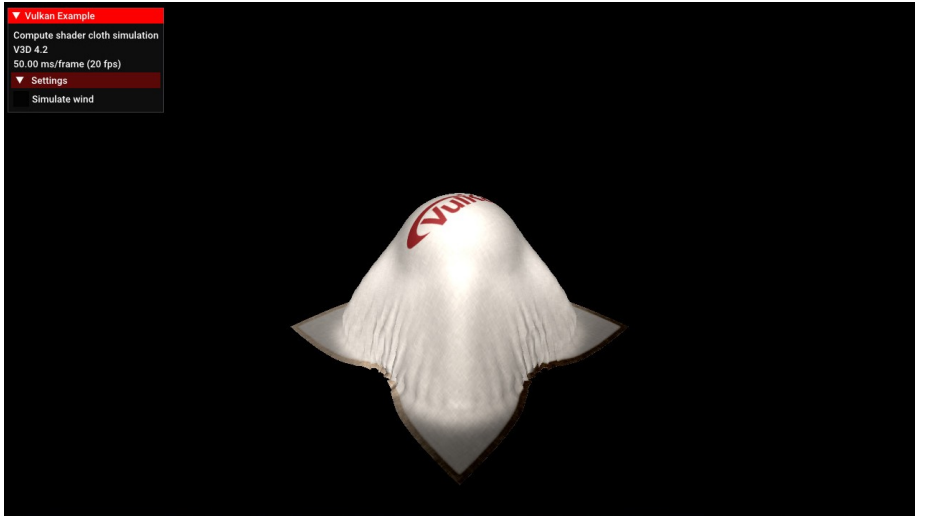


igalia

Current State

- Many demos from Sascha Willems working:





igalia

Current State

- Not much performance work yet.
  - Mostly for the Quake games.
  - VkQuake3 much faster than its GL1 renderer.

igalia

Current State

- Aware of some slow paths in the driver.
  - Particularly for some cases of transfer ops.
  - Possibly underused TFU unit.

igalia

Implementation Challenges

igalia

Implementation Challenges

- Vulkan expects everything to execute in GPU.
  - Not quite possible for us in a few selected cases.
  - Caused some implementation churn.
  - Incurs in additional coordination (flushes).

igalia

Implementation Challenges

- Linear display pipeline in Raspberry Pi 4
  - V3D cannot sample from linear images.
  - For now, we don’t support sampling on swapchains.
  - We should be able to sample in windowed mode when running inside a compositor… worth it?

igalia

Implementation Challenges

- Vulkan pipeline state not always sufficient.
  - Would like to emit shader variants based on texture formats for optimal performance.
  - We don’t know formats until descriptors are bound.
  - Pre-compile 2 shader variants in advance.
    - Optimal case: use 16-bit return size for all textures.
    - Fallback case: use 32-bit return size for all textures.

igalia

Implementation Challenges

- Mesa WSI implementation not optimal for us.
  - Optimal path requires PCI GPU and VK_EXT_pci_bus_info.
  - Raspberry Pi display device is not a PCI device.
    - We just want to check that DRI3 device matches.
  - RFC MR with a solution proposed.

igalia

Future Plans

Future Plans

- Short term:
  - Vulkan 1.0 conformance.
  - Merge in Mesa.

igalia

Future Plans

- Long term:
  - Explore better TFU unit usage.
  - Better WSI platform support.
  - Optimal implementation of input attachments.
  - Optional features & extensions, maybe Vulkan 1.1?

igalia

Future Plans

- Long term:
  - Improve code reuse with GLES driver.
  - Maybe port some features to GLES driver:
    - Hardware multisample resolve.
    - Sample rate shading.
    - Robust buffer access.
    - Etc.

igalia

Future Plans

- Long term:

More real world testing!!

Contributing

Contributing

- Stable context to enable external contributors.
- V3D 4.2 docs not available to general public.
  - GLES 3.1 open source driver can make up for this.
- Lots of FIXMEs in the source code.
- Many optional features pending.
- Testing and performance feedback.

igalia

Contributing

- Resources:
  - #videocore @ freenode
  - mesa-dev mailing list
  - Gitlab issues

igalia

Special Thanks

- Mesa community, for NIR, SPIR-V translator, WSI bits, etc.
- Existing Mesa Vulkan driver developers.
- Eric Anholt
- Dave Emett
